433Mhz Fixed Code Cloning Remote

Introduction

Thanks for purchasing the Control FreQ cloning remote control.

It will copy 433Mhz fixed code remote controls only. That is remote controls that operate on the 433Mhz frequency band and are set using a series of dip switch, usually under the battery cover.

The switches are set either on or off which fixes the code to a certain frequency that also matches the switches on the existing receiver.

The cloning remote control simply listens for this frequency and sets itself to the same thereby duplicating that fixed code and operating as if it was the same type.

CLONING PROCEDURE

To copy your existing 433Mhz fixed code remote control...

1. Press and hold buttons A & B on the cloning remote for 20 seconds

Result: The red led will flicker

2. Remove both fingers from A & B and then press just the button you want to learn

Result: The red led will flicker

3. Holding the 2 remotes together, press the button of the 433Mhz fixed code remote control you want to copy (your old remote)

Result: The red led will flicker

The Cloning remote control should now operate as the existing remote.
